Stack

- ◆ A stack is a sequence in which:
 - ◆ Items can be added and removed only at one end (the top)
 - ◆ You can only access the item that is currently at the top
- ◆ Stack Analogy

3

Stack

- ◆ **First In Last Out (FILO)**
 - ◆ Constrained item access
- ◆ Major Operations
 - ◆ **push**: add an item to the top of the stack
 - ◆ **pop**: remove the item at the top of the stack
- ◆ Illustration

4

Stack Operation

- ◆ **push**: add an item to the top of the stack
- ◆ **pop**: remove the item at the top of the stack
- ◆ **top/peek**: get the item at the top of the stack, but do not remove it
- ◆ **isEmpty**: test if the stack is empty
- ◆ **isFull**: test if the stack is full
- ◆ **clear**: clear the stack, set it as empty stack
- ◆ **size**: return the current size of the stack

5

Implementation of Stack

- ◆ Array-based Stack
- ◆ Linked Stack

6

Implementation of Stack

- ♦ Array based Stack
 - ♦ MAX_SIZE = n // the max size of stack
 - ♦ top = -1 // the current top position
 - ♦ Array S with n elements

Example

- ♦ MAX_SIZE = 5
- ♦ top = -1
- ♦ Array S

7

Push Operator

- ♦ push(item):
 1. top++;
 2. S[top] = item

push(1)

8

Push Operator

- ♦ push(item):
 1. top++;
 2. S[top] = item

- ♦ push(1)
- ♦ push(4)

9

Push Operator

- ♦ push(item):
 1. top++;
 2. S[top] = item

- ♦ push(1)
- ♦ push(4)
- ♦ push(5)

10

Push Operator

- ♦ push(item):
 1. top++;
 2. S[top] = item

- ♦ push(1)
- ♦ push(4)
- ♦ push(5)
- ♦ push(6)

11

Push Operator

- ♦ push(9) top=4 → S[4] ← push(9)

- ♦ push(10) top=5 →
 - ♦ OVERFLOW
 - ♦ How to avoid that?

12

Push / Pop Operator

- ```
❖ push(item):
1. if(top == MAXSIZE-1)
2. Stack is FULL! No push!
3. else
4. top++;
5. S[top] = item

❖ pop(): // should avoid underflow
1. if(top == -1)
2. Stack is EMPTY! No pop!
3. else
4. top--;
```

13

## Application of Stacks

- ◆ Making sure the delimiters (parens, brackets, etc.) are balanced:
  - ◆ Push open (i.e., left) delimiters onto a stack
  - ◆ When you encounter a close (i.e., right) delimiter, pop an item off the stack and see if it matches
- ◆ Evaluating arithmetic expressions
  - ◆ Parsing arithmetic expressions written using infix notation
- ◆ The runtime stack in memory
  - ◆ Converting a recursive algorithm to an iterative one by using a stack to emulate the runtime stack

14

## Brackets Balance Problem

- [illegible]

15

## Brackets Balance Problem

- ❖ Given a bracket expression, determine whether it is balanced or not?
- ❖ **{[ ] ( [ ] ) }**
  - ❖ How to solve it by using stack?
  - ❖ Bracket pairs: **( )**, **[ ]**, **{ }**
  - ❖ Any ideas?
- ❖ **Methodology**
  - ❖ Employ stack store checked left bracket
  - ❖ Pop out left bracket if it is matched

16

## Arithmetic Expression Evaluation

- ◆ Arithmetic expression
  - ◆ operands (a, b, c), operator (+, \*)
  - ◆  $a + b * c$
- ◆ Prefix expression
  - ◆  $+ a * b c$
- ◆ Infix expression
  - ◆  $a + b * c$
- ◆ Postfix expression
  - ◆  $a b c * +$

17

## Postfix Expression

- ◆ Infix expression
  - ◆  $5 * ((9 + 3) * (4 * 2) + 7)$
- ◆ Postfix expression
  - ◆  $5\ 9\ 3\ +\ 4\ 2\ *\ 7\ +\ *$
- ◆ Parse postfix expression is somewhat easier problem than directly parsing infix (why)
- ◆ Postfix has a nice property that parentheses are unnecessary
- ◆ Postfix Expression Evaluation
  - ◆ Convert from infix to postfix
  - ◆ Evaluate a postfix expression

18

## Postfix Expression

- ◆ Postfix expression
  - ◆  $5\ 9\ 3 + 4\ 2 ** 7 + *$
- ◆ Methodology
  - ◆ Read the tokens in one at a time
  - ◆ If it is an operand, push it on the stack
  - ◆ If it is a binary operator:
    - ◆ pop top two elements from the stack,
    - ◆ apply the operator,
    - ◆ and push the result back on the stack

19

## Postfix Expression Evaluation

- ◆  $5\ 9\ 3 + 4\ 2 ** 7 + *$
- ◆ Postfix Expression Evaluation

| ◆ push(pop() * pop()) | 515            |

## Our Roadmap

- ◆ Stack
- ◆ Queue
- ◆ Stack vs. Queue

21

## Queue

- ◆ A queue is a sequence in which:
  - ◆ items are added at the rear and removed from the front
  - ◆ You can only access the item that is currently at the front
- ◆ Queue Analogy

22

## Queue

- ◆ First In First Out (FIFO)
  - ◆ Items access constrained
- ◆ Major elements
  - ◆ **front**: the first element in the queue (remove)
  - ◆ **rear**: the last element in the queue (add)
- ◆ Illustration

23

## Queue Operations

- ◆ enqueue: add an item at the rear of the queue
- ◆ dequeue: remove the item at the front of the queue
- ◆ front: get the item at the front of the queue, but do not remove it
- ◆ isEmpty: test if the queue is empty
- ◆ isFull: test the queue is full
- ◆ clear: clear the queue, set it as empty queue
- ◆ size: return the current size of the queue

24

  2.     S[rear] = item
  3.     rear++
  3. else
  4.     Queue is FULL, no enQueue

26

# deQueue Operator

- ♦ deQueue():
  1. if(front < rear)
  2.     front++
  3. else

  - ♦ Data buffers (iPod, TiVo).
  - ♦ Asynchronous data transfer (file IO, pipes, sockets).
  - ♦ Dispensing requests on a shared resource (printer, processor)
